North Region Operations Engineer

## MDOT North Region Toward Zero Deaths Implementation Plan

### TZD in Michigan

- National Strategy adopted by MDOT in 2010
- Primary focus has been increasing awareness

- These are good strategies for raising awareness in Michigan, but are they good strategies for reducing fatal crashes in the North Region?

## High Level Crash Analysis

Total Crashes - Trunkline

Fatal Crashes - Trunkline

## High Level Crash Analysis

Total Crashes - Local Roads

Fatal Crashes - Local Roads

## High Level Crash Analysis

## TZD Implementation Plan

- Four focus areas have been identified:
  - Trunkline Lane Departure
  - Trunkline Angle Crashes
  - Local Roads
  - Public Education
- Each focus area includes:
  - Strategies
  - Procedures for tracking implementation
  - Processes for measuring success

## TZD Implementation Plan

- Four focus areas have been identified:
  - **Trunkline Lane Departure**
  - Trunkline Angle Crashes
  - Local Roads
  - **Public Education**
- Each focus area includes:
  - Strategies
  - Procedures for tracking implementation
  - Processes for measuring success

## Lane Departure Crashes

- Why do they occur?
  - Driver distraction, inattention or impairment
  - Adverse Road Conditions
  - Speed too fast
- Where do they occur?
  - Everywhere.
  - Curves are more susceptible
  - Most fatal crashes occur in rural settings

## Lane Departure Crashes

- Two primary mitigation strategies:
  - Implement Measures to keep a driver from leaving:
    - His or Her lane
    - The Roadway
  - Implement measures to reduce the impact if a vehicle does leave the roadway

## Trunkline Lane Departure

- Strategy #1: Identify locations with high lane departure crash frequency compared to the rest of North Region trunklines...

## Trunkline Lane Departure

- **Strategy #5: Road R&R Projects:** *Develop a justification process for NOT constructing full paved shoulders on roadways of 45 MPH speed limit or higher with supplemental shoulder rumble strips. An example of a viable justification would be significant environmental impacts, in which case the project should include other countermeasures (i.e. edge line rumble strips, safety edge).*
- **Strategy #8: High Friction Surface:** Spot treatments for curves or intersections with a history of wet crashes and/or low pavement friction values.

## Public Education

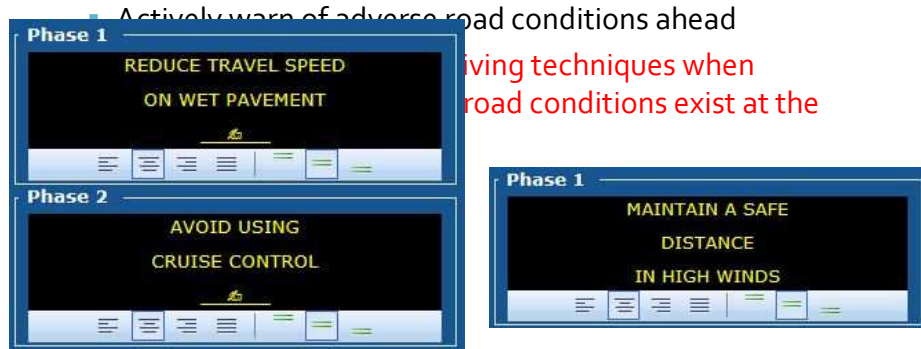

## Public Education

- Strategy #4: Utilize freeway message signs to do the following:
  - Actively warn of adverse road conditions ahead

## Public Education

- Strategy #4: Utilize freeway message signs to do the following:

## Public Education

- Strategy #1: Utilize freeway message signs to do the following:

## Conclusion

- Current 5 Year Plan for North Region Safety:
  - \$13 Million
  - 5 Fatal Crashes being addressed
  - 2 out of 5 fatal crashes were lane departure
- North Region TZD Implementation Plan is a shift in focus from:
  - Crash *Locations* to...
  - Crash *Types*
